## springboot框架的搭建

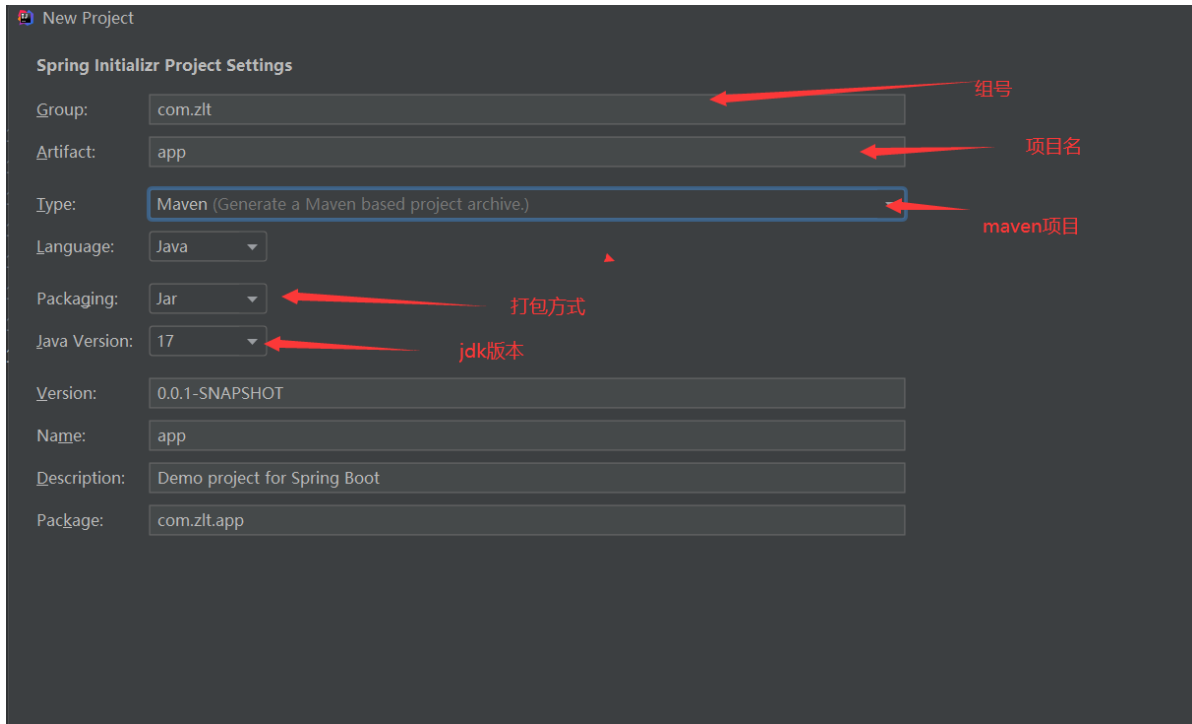

1

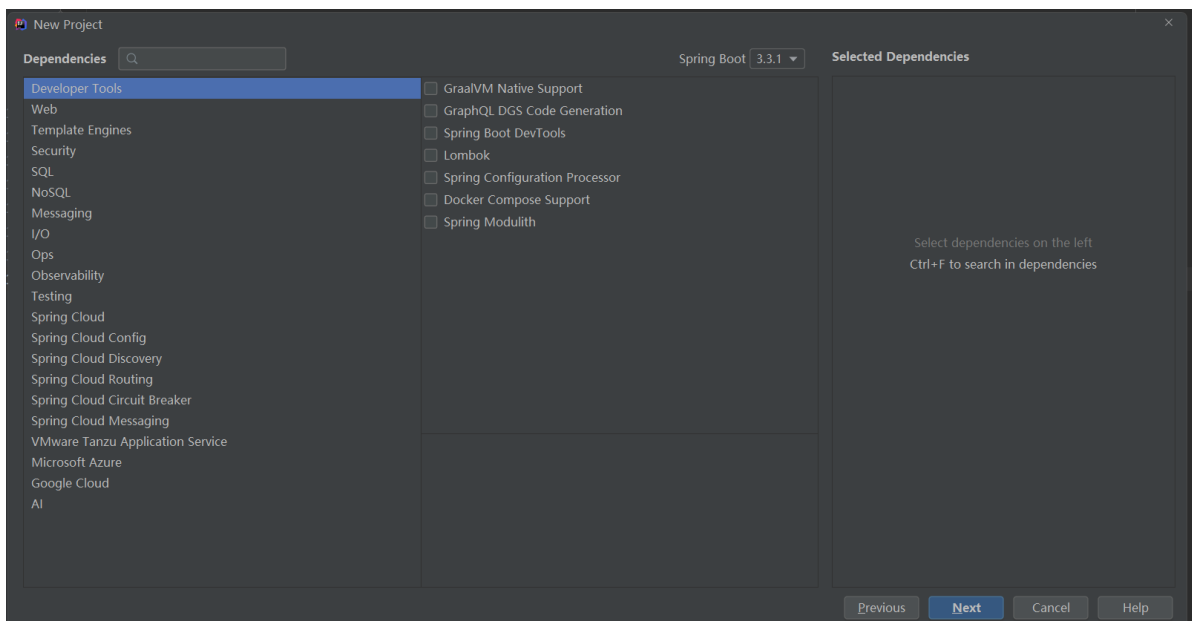

2

3.

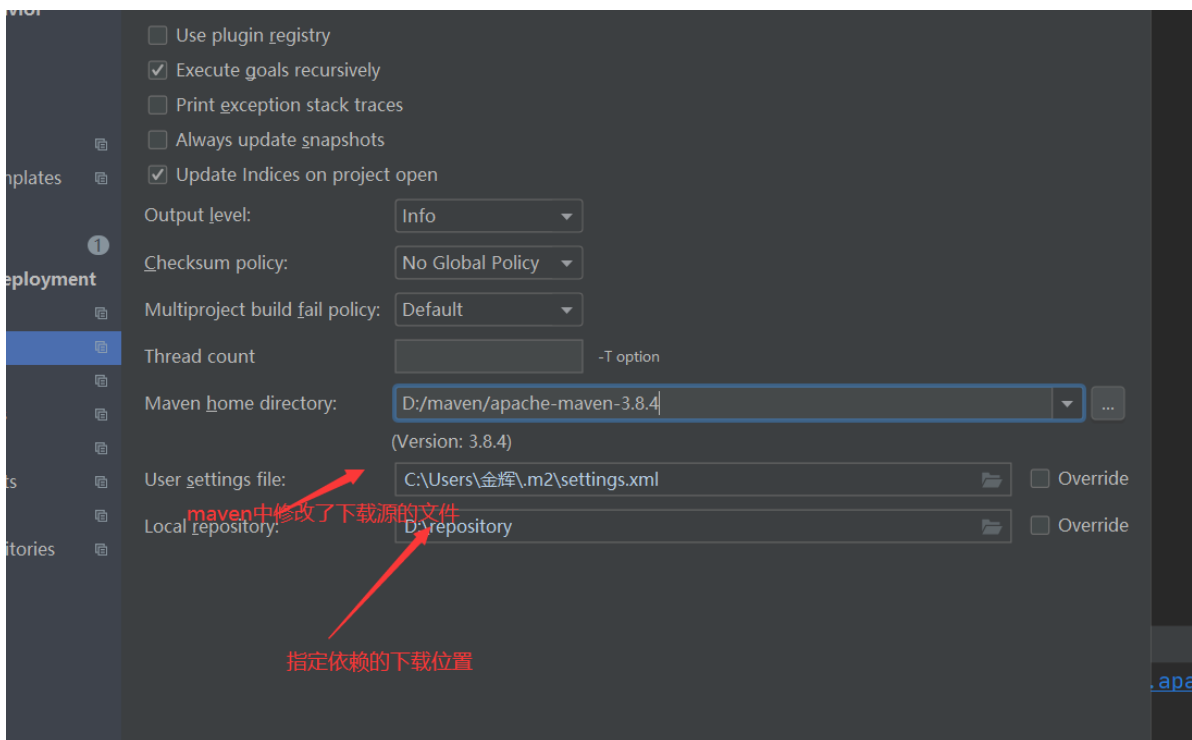

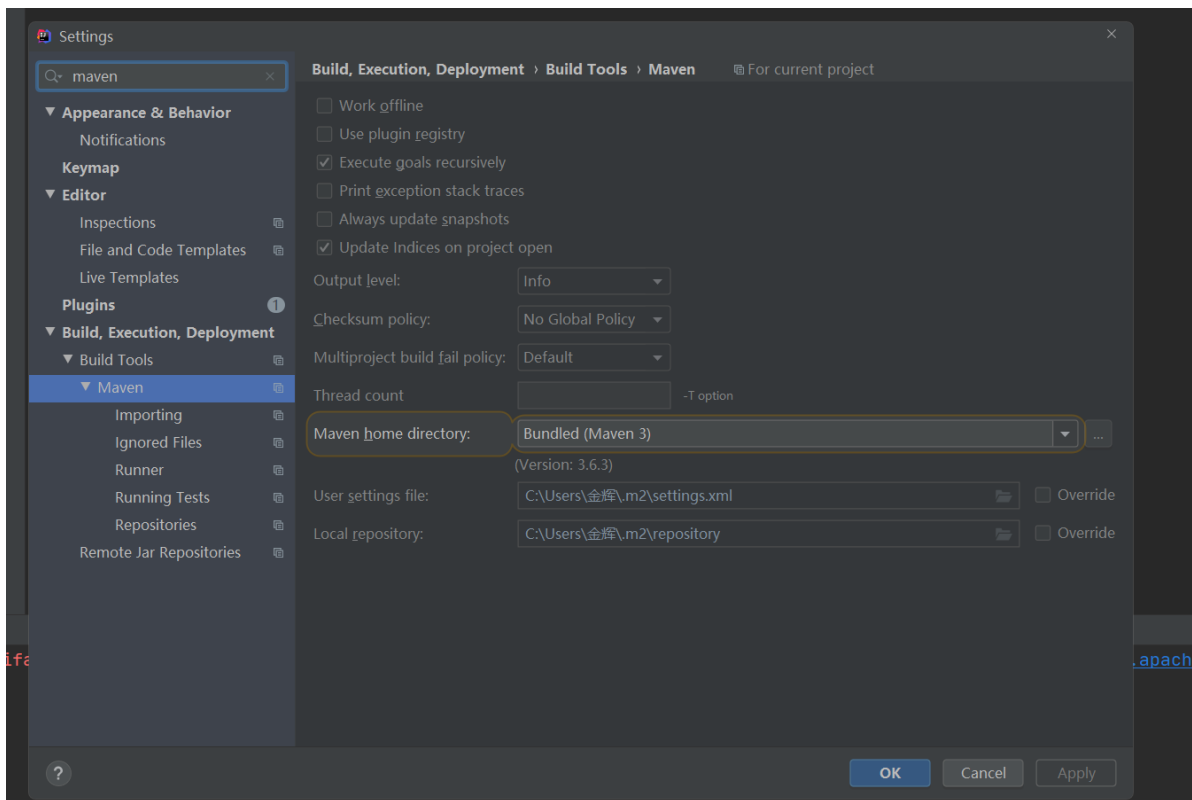

4.生成项目的是时候选的依赖

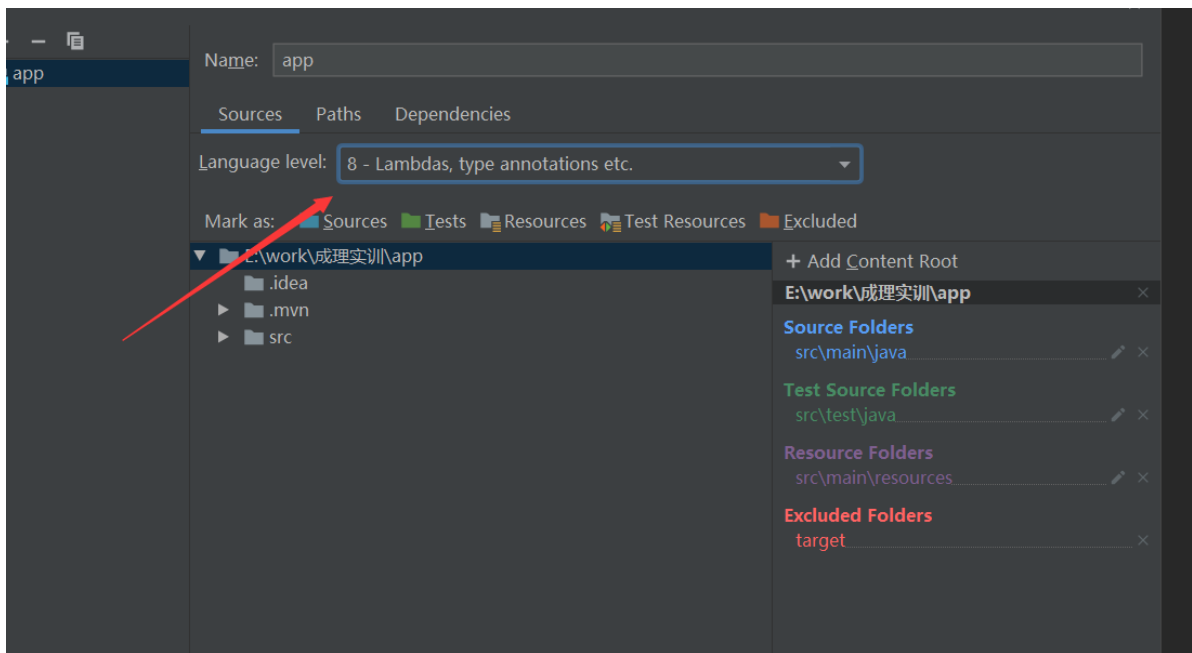

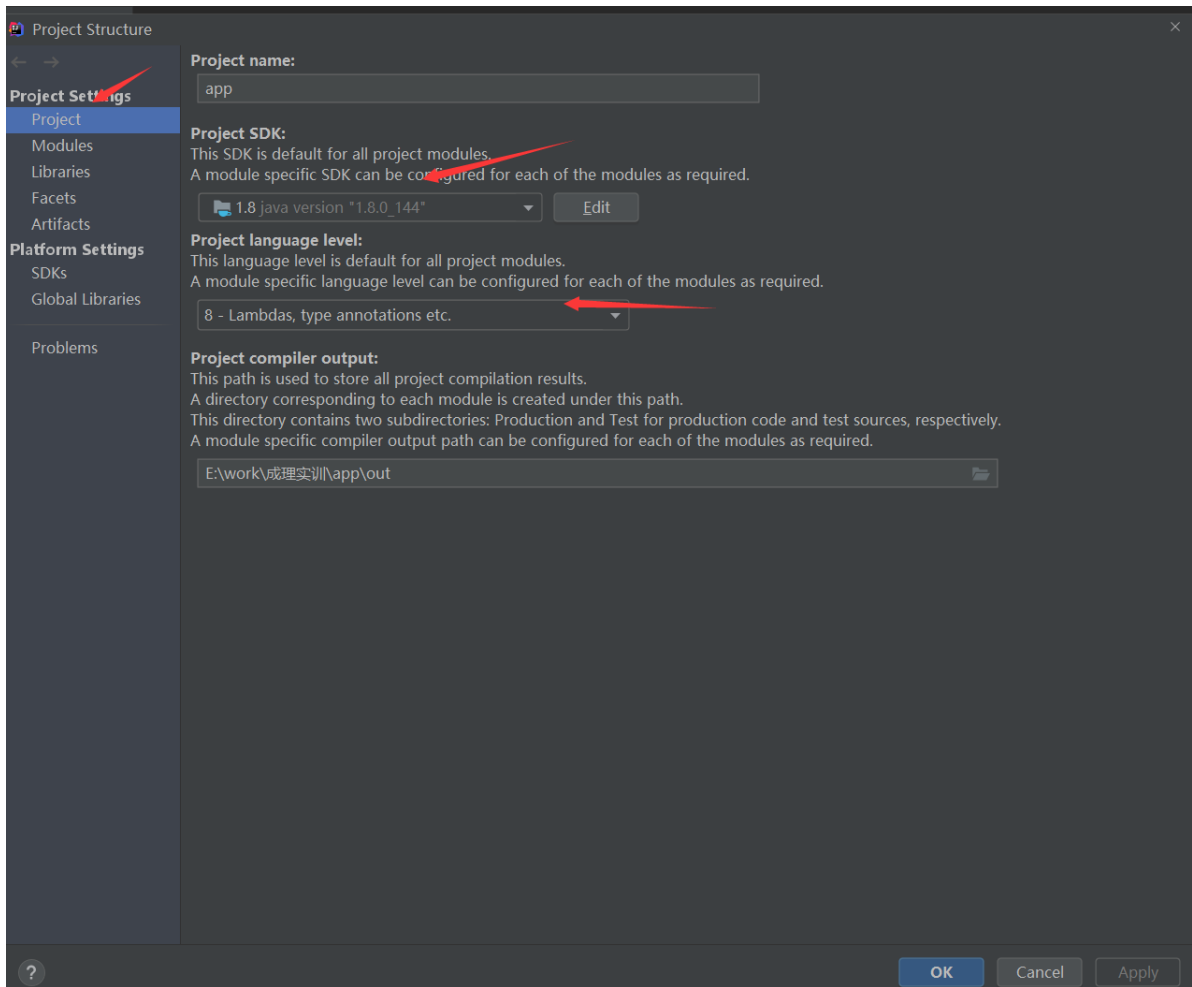

5讲maven配置进项目中 点击filesettings

统一jdk版本

待依赖下载完成之后，启动项目

```
Description:

Failed to configure a DataSource: 'url' attribute is not specified and no embedded datasource could be configured.

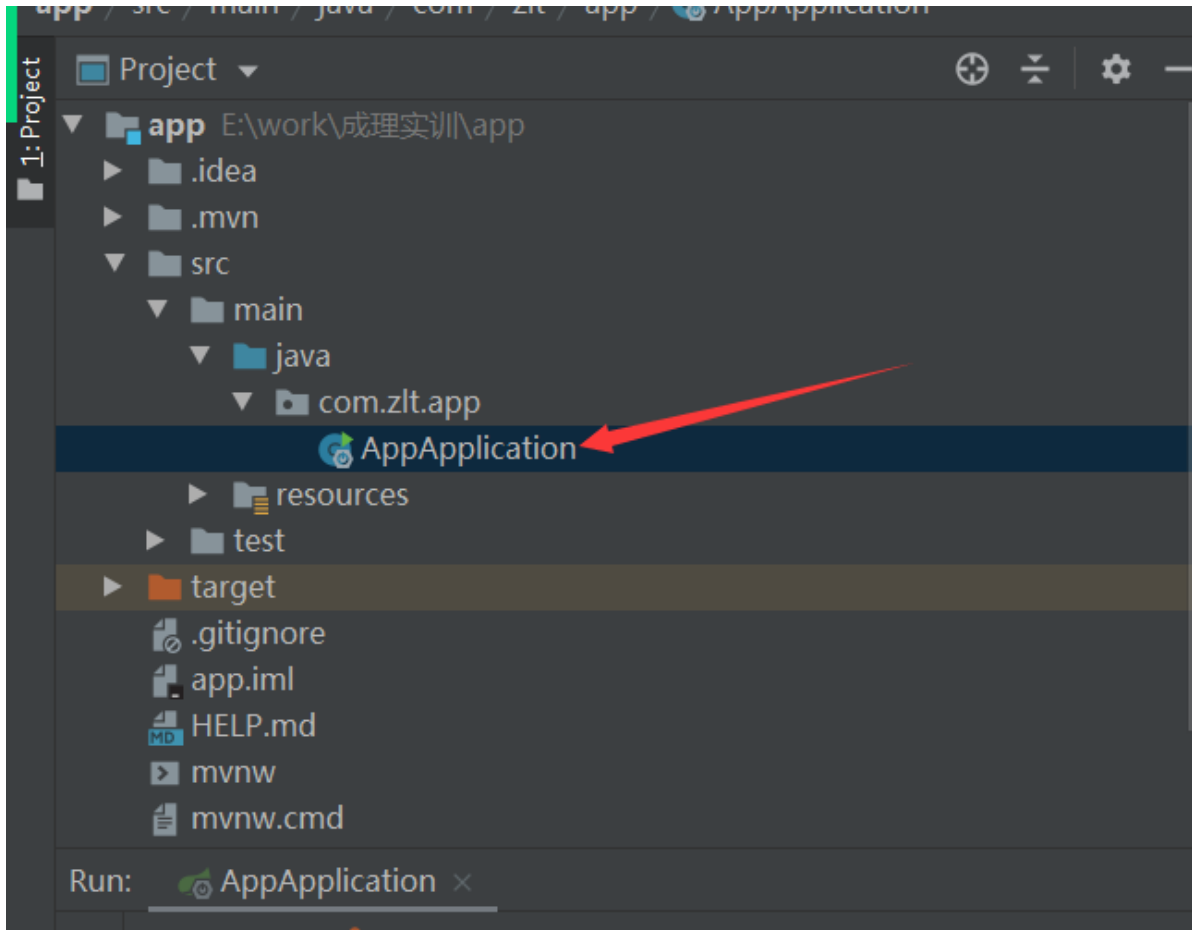

Reason: Failed to determine a suitable driver class

Action:

Consider the following:
  If you want an embedded database (H2, HSQL or Derby), please put it on the classpath.
  If you have database settings to be loaded from a particular profile you may need to activate it (no profiles are currently active).
```

没用配置数据源

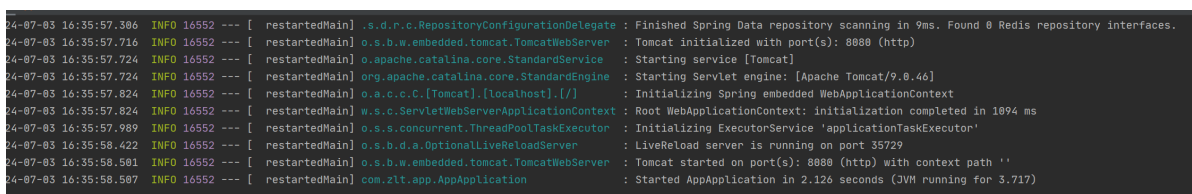

找到项目的启动类

在@SpringBootApplication中添加exclude=DataSourceAutoConfiguration.class

重新启动项目 如下图 启动成功

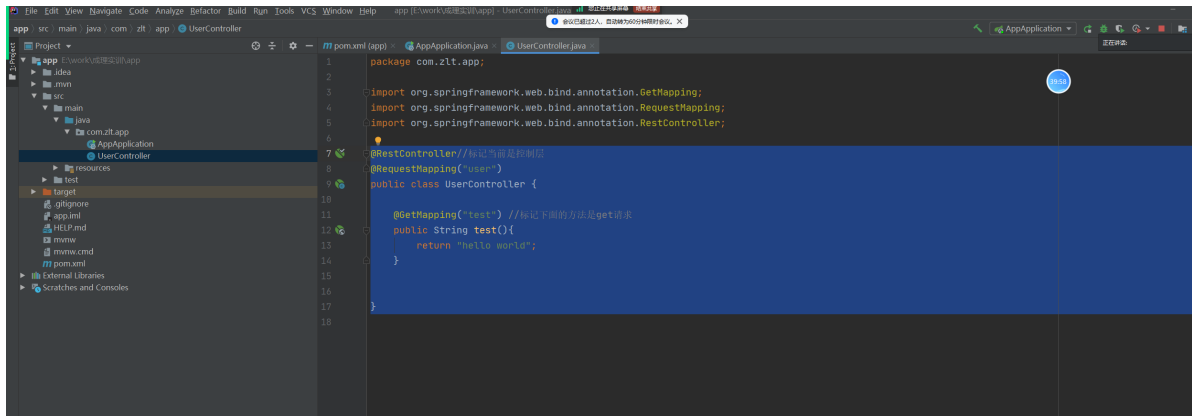

```

@RestController//标记当前是控制层
@RequestMapping("user")
public class UserController {

    @GetMapping("test") //标记下面的方法是get请求
    public String test(){
        return "hello world";
    }

}

```

访问 [127.0.0.1:8080/user/test](http://127.0.0.1:8080/user/test)

返回

可以完成基于spring boot的请求响应
